WB B inside π

Some basics of form factors

Concept of the form factor

Elastic scattering cross section on a point-like vs. extended object e.g., the Ratherford or Mott $(eX \to eX)$ scattering

$$\frac{d\sigma}{d\Omega} = \frac{d\sigma}{d\Omega_{\text{point-like}}} |F(\vec{q}^{\,2})|^2$$

momentum transfer $\vec{q} = \vec{p}_f - \vec{p}_i$.

Information on the spatial distribution of scatterers (charge) $\rho(r)$ in the target:

Form factor

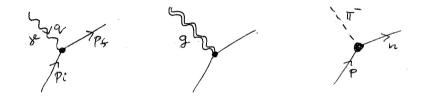

$$F(\vec{q}^{\,2}) = \int d^3r \, e^{i\vec{q}\cdot\vec{r}} \rho(r) = \int d^3r \, j_0(|\vec{q}|) \rho(r)$$

At low q we have $F(\vec{q}^{\,2})=\int d^3r\,\rho(r)-\frac{1}{6}\vec{q}^{\,2}\,\int d^3r\,r^2\rho(r)+\cdots=$ "charge" $-\frac{1}{6}\vec{q}^{\,2}\,\mathrm{msr}$

WB B inside π

Different probes of the structure

electric magnetic strangeness ... mass (gravitational) ... composite operators ... hadronic

scattering amplitude $=\sum$ tensorial structure \times form factor (scalar function) Extracted from scattering data and lattice QCD

WB B inside π UJK

Relativistic kinematics

$$q = p_f - p_i$$
, $t = q^2 = q_0^2 - \vec{q}^2 = -Q^2$, $p_i^2 = p_f^2 = m^2$

$$F = F(t)$$

"Charge"

Mean squared radius

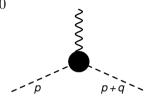

$$\langle r^2 \rangle = 6 \frac{dF(t)}{dt} \bigg|_{t=0}$$

Transverse density

$$\rho(b) = \int \frac{d^2 q_{\perp}}{(2\pi)^2} e^{-i\vec{q}_{\perp} \cdot \vec{b}} F(-\vec{q}_{\perp}^2)$$

Field theoretic definition

On-shell matrix element of an operator at $\boldsymbol{x} = \boldsymbol{0}$

Example: electromagnetic form factor of a (pseudo) scalar particle

$$\langle h(p)|J^{\mu}(0)|h(p+q)\rangle = (2p^{\mu} + q^{\mu})F(q^2)$$

conserved: $\partial_{\mu}J^{\mu}=0 o {
m Ward-Takahashi}$ identities

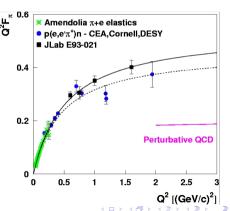

$$\rightarrow q_{\mu}(2p^{\mu} + q^{\mu}) = (p+q)^2 - p^2 = m^2 - m^2 = 0$$

WB B inside π

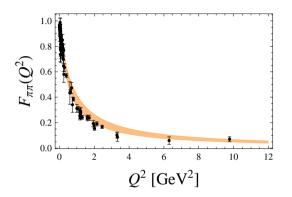

Why the pion?

Pion - the "hydrogen atom of QCD"

- Simplest and most fundamental hadron pseudo-Goldstone boson of the spontaneously broken chiral symmetry
- Simpler theoretically there are model approaches working in the non-perturbative regime
- Easier than p on the lattice, there \exists data
- ullet Experimental data for the charge form factor [compilation: T. Horn] ightarrow
- pQCD: $F_{\pi}(Q^2)Q^2 \to 16\pi\alpha(Q^2)f_{\pi}^2\left[1+6.58\alpha(Q^2)/\pi+...\right]$

Pion EM form factor

$$F(Q^2) = \frac{m_{\rho}^2}{1 + Q^2/m_{\rho}^2}$$

Vector meson dominance model fits the data well

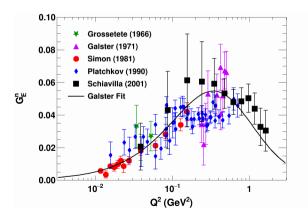

WB

Baryon in the pion?

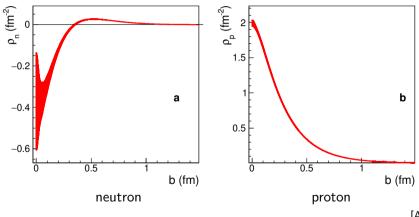

Neutron electric charge ff

The neutron, which has no electric charge, has a non zero charge form factor for $q^2 \neq 0$:

unpolarized elastic ed scat. [Obrecht 2019]

Neutron electric charge distribution (in the transverse plane)

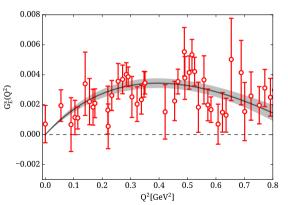

[Atac et al. 2021]

15 / 37

Strangeness in the nucleon

Another case: strange ff's of the nucleon, $G_{E,M}^{s}$

[Jaffe 1989, Musolf, Burkardt 1993, Cohen, Forkel, Nielsen 1993,...]

Alexandrou et. al (lattice ETM Coll.) 2020

Symmetries and the baryon ff of the pion

WB B inside π UJł

Divergence of vector currents in QCD

$$\partial_{\mu} \left[\bar{q}_a(x) \gamma^{\mu} q_b(x) \right] = i(m_a - m_b) \bar{q}_a(x) q_b(x), \quad a, b = u, d, s, c, b, t$$
 -flavor

 $m_a = m_b \rightarrow$ conservation of vector currents, quark number of any species conserved

Gell-Mann-Nishijima formula

$$Q = I_3 + \frac{1}{2}(B + s + c + b + t)$$

For the pion heavier flavors can be neglected (OZI, large- N_c):

$$J_{B}^{\mu} = \frac{1}{N_{c}} \left(\bar{u} \gamma^{\mu} u + \bar{d} \gamma^{\mu} d \right), \quad J_{3}^{\mu} = \frac{1}{2} \left(\bar{u} \gamma^{\mu} u - \bar{d} \gamma^{\mu} d \right), \quad J_{Q}^{\mu} = J_{3}^{\mu} + \frac{1}{2} J_{B}^{\mu} \quad \text{(all conserved)}$$

18 / 37

WB B inside π

Baryon, isospin, and charge form factors

$$\langle \pi^a(p) \mid J^{\mu}_{B,3,Q}(0) \mid \pi^a(p+q) \rangle = (2p^{\mu} + q^{\mu}) F^a_{B,3,Q}(q^2), \quad a = 0, +, - \text{ (pion isospin)}$$

$$\pi^0$$
: $I^G(J^{PC}) = 1^-(0^{-+})$, π^{\pm} : $I^G(J^P) = 1^-(0^-)$, $C|\pi^{\pm}\rangle = |\pi^{\mp}\rangle$, $G = Ce^{i\pi I_2}$

$J^{\mu}_{B.3.O}$ are **odd** under C ightarrow 0

$$F_{B,3,Q}^{\pi^0}(q^2)=0$$
 and $F_{B,3,Q}^{\pi^+}(q^2)=-F_{B,3,Q}^{\pi^-}(q^2)$ — always true!

$$\text{e.g., } \langle \pi^0(p)|J_B^\mu(0)|\pi^0(p+q)\rangle = -\langle \pi^0(p)|CJ_B^\mu(0)C|\pi^0(p+q)\rangle = -\langle \pi^0(p)|J_B^\mu(0)|\pi^0(p+q)\rangle = 0$$

$$\text{or } \langle \pi^+(p)|J_B^\mu(0)|\pi^+(p+q)\rangle = -\langle \pi^+(p)|CJ_B^\mu(0)C|\pi^+(p+q)\rangle = -\langle \pi^-(p)|J_B^\mu(0)|\pi^-(p+q)\rangle$$

◆ロト ◆園 ト ◆ 園 ト ◆ 園 ・ 夕 ♀ ○

Similarly, for exact isospin (and G) symmetry (assuming $m_u = m_d$ and neglecting small EM effects)

J^{μ}_{B} is **odd** under $G \rightarrow$

$$F_B^{\pi^\pm}(q^2)=0$$
 $\left(F_3^{\pi^\pm}(q^2) \neq 0, \text{ as } J_3^\mu \text{ is even under } G\right)$

However, in the real world the isospin (and G) are broken (a.k.a. charge symmetry breaking) with $m_d > m_u$ and EM effects

$$F_B^{\pi^\pm}(q^2)$$
 may be (and is) nonzero, with $F_B^{\pi^+}(q^2) = -F_B^{\pi^-}(q^2)$

As the baryon charge of the pion is 0, we have

$$F_B^{\pi^{\pm}}(0) = 0 \quad \text{(but not at } q^2 \neq 0\text{)}$$

On the other hand, $F_3^{\pi^{\pm}}(0)=\pm 1$ (the 3-component of isospin)

20 / 37

WB B inside π

- As a rule, if a quantity is not protected by symmetry, hence may be nonzero, it is nonzero
- There is the question of magnitude, proportional to the strength of the symmetry breaking
- ullet No probes with baryon number couple directly to the pion (except for lattice QCD) o we need indirect methods to estimate the effect

Mass splitting

 $\Delta m \equiv m_d - m_u = 2.8(2) {
m MeV} \; (m_u = 2.01(14) {
m MeV}, \; m_d = 4.79(16) {
m MeV} \; [{
m Davies \; et \; al. \; 2009}])$

ullet EM violating effects more tricky to estimate/evaluate, of the order $lpha_{
m QED}/(2\pi)\sim 0.001$

21/37

WB B inside π UJK

Effective Lagrangian estimate

Order of magnitude from effective Lagrangian (χ PT)

At leading order in the pion momenta and the quark mass splitting

$$J_B^{\mu} = -2i\frac{c\Delta m}{\Lambda^3}\partial_{\nu}\left(\partial^{\mu}\pi^{+}\partial^{\nu}\pi^{-} - \partial^{\nu}\pi^{+}\partial^{\mu}\pi^{-}\right) + \dots$$

c – dimensionless number, Λ – typical hadronic scale

 J_B^μ is odd under C, trivially conserved, and yields $F_B^{\pi^+}(q^2)=q^2c\Delta m/\Lambda^3+\dots$

Baryonic ms radius

$$\langle r^2\rangle_B^{\pi^+}=6c\Delta m/m_\rho^3\simeq c~0.002 {\rm fm}^2\simeq c(0.04 {\rm fm})^2$$

– small compared to the charge radius $\langle r^2 \rangle_Q^{\pi^+} = 0.434(5) \mathrm{fm}^2 = (0.659(4) \mathrm{fm})^2$

<□ > <□ > <□ > <□ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □ > < □

WB B inside π

Quark-model estimates

Mechanistic explanation

 \bar{d} is a bit heavier than u, hence its distribution is somewhat more compact.

 $\pi^+ = u\bar{d}$, u - baryon charge (matter), \bar{d} - antibaryon charge (antimatter)

WB

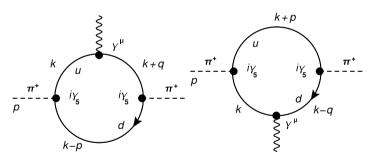

Mechanistic explanation

 \bar{d} is a bit heavier than u, hence its distribution is somewhat more compact.

Nambu-Jona-Lasinio (NJL) model

Covariant field-theoretic model. Dynamical chiral symmetry breaking, point-like interaction, large- N_c (one-loop), regularization. Generally very successful in pion low-energy phenomenology

NJL:
$$\langle r^2 \rangle_B^{\pi^+} \simeq (0.06 \text{ fm})^2$$

26 / 37

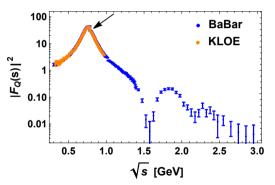

WB B inside π UJK

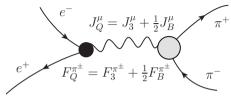

Determination from exp. data (!)

WB B inside π UJK 27/3

$e^{+}e^{-} \to \pi^{+}\pi^{-}$

Long tradition of $e^+e^- \to \pi^+\pi^-$ measurements

 \leftarrow Arrow indicates a wiggle due to $F_{R}^{\pi^{\pm}} \neq 0!$

(relevant for hadronic vacuum polarization in q-2)

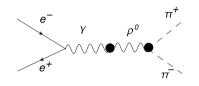

28 / 37

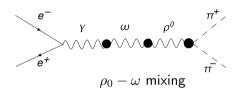

WB

Vector meson dominance

isospin part

baryonic part

$$F_3^{\pi^+}(s) = \frac{1}{1 + c' + c'' + c'''} [D_{\rho^0}(s) + c'D_{\rho'^0}(s) + c''D_{\rho''^0}(s) + c'''D_{\rho''^0}(s)]$$

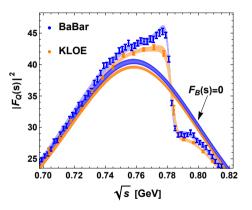

$$\frac{1}{2} F_B^{\pi^+}(s) = c_{\rho^0 \omega} {}^{s} D_{\rho^0}(s) D_{\omega}(s), \qquad D_V(s) = \frac{m_V^2}{m_V^2 - s - i \, m_V \Gamma_V(s)}$$

[Gounaris-Sakurai 1968, largely used by exp. groups]

29 / 37

Our fit to KLOE and BaBar

 \dots shown in the relevant range of s

Necessity of $F_R^{\pi^{\pm}} \neq 0$ (or $\rho - \omega$ mixing) Unresolved discrepancy between KLOE and BaBar!

WB

Continuation space-like Q^2 with the dispersion relation

BaBar: $\langle r^2 \rangle_B^{\pi^+} \simeq (0.0411(7) \text{ fm})^2$, KLOE: $\langle r^2 \rangle_B^{\pi^+} \simeq (0.0412(12) \text{ fm})^2$

(stat. errors only)

WB

B inside π

Comparison of our various estimates

approach	$\langle r^2 \rangle_B^{\pi^+}$	comment
effective Lagrangian	$c(0.04 \text{ fm})^2$	c - number of order 1
NJL	$(0.06 \text{ fm})^2$	Δm effects only
BaBar	$(0.041(1) \text{ fm})^2$	exp. statistical error only
KLOE	$(0.041(1) \text{ fm})^2$	exp. statistical error only

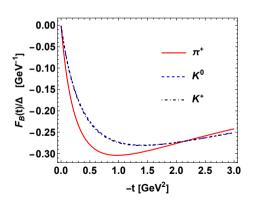

- Order of magnitude agreement between very different methods
- ullet BaBar and KLOE extractions incorporate both Δm and EM breaking (but EM canceled from the initial and final state interactions via ratio to the muon pair production)

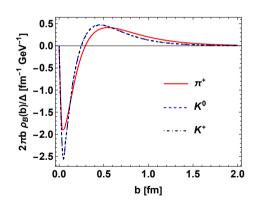

WB B inside π UJK 32/37

Baryon in the kaon

Kaon in NJL

Full analogy to π^+ : for $K^+=u\bar{s}$ replace $d\to s$, for $K^0=d\bar{s}$ replace $u\to d$ and $d\to s$ NJL: $m_s/m=26$ (fits m_K), PDG: $m_s/m=27.3^{+0.7}_{-1.3}$

(for π^+ , K^0 , K+, correspondingly, $\Delta=M_d-M_u$, $\Delta=M_s-M_d$, $\Delta=M_s-M_u$

WB B inside π UJK 34/37

Kaon baryonic radius

NJL:

$$\langle r^2 \rangle_B^{K^+} = (0.24(1) \text{ fm})^2, \quad \langle r^2 \rangle_B^{K^0} = (0.23(1) \text{ fm})^2$$

In NJL, $\langle r^2 \rangle_B^{K^0} = -\langle r^2 \rangle_Q^{K^0}$, since the baryon number and electric charge of d and \bar{s} quarks are equal and opposite

PDG:

$$\langle r^2 \rangle_Q^{K^0} = -(0.28(2) \ {
m fm})^2$$
, of the same sign and close in magnitude to NJL

Within the reach of the lattice

WB B inside π UJK 35/37

Conclusions

WB

Outlook

- Intriguing, fundamental feature of the pion, eventually should end up in the PDG Tables
- Small, but as shown, possible to extract from the present experimental data could be elevated to strict determination after some experimental and theoretical systematic issues are resolved
- **3** Estimates from very different approaches yield $\langle r^2 \rangle_B^{\pi^+} = (0.03 0.06 \text{ fm})^2$, the sign agrees with the mechanistic interpretation
- Lattice QCD: $\langle r^2 \rangle_Q^\pi = (0.648(15)~{\rm fm})^2 = 0.42(2)~{\rm fm}^2$ our signal for the baryon ff is a factor of ~ 10 too small (0.002 vs the accuracy of 0.02) to be currently detected (but still could be tried)
- Good lattice prospects for the kaon or heavy-light mesons

THANKS FOR YOUR ATTENTION!

37 / 37

WB B inside π UJK
